Faculty of Mathematics and Physics, Charles University, Prague

# The **Two Flavors** of Quantum-Resistant Mechanisms

---

- **Cryptographic protocols based on quantum mechanics laws**

- Quantum Key Distribution (QKD), for instance
- unconditionally secure, provided everything in the whole scheme is
- speed versus distance limits
- cloud limits or even impossibility
- not every classical scheme has its practical quantum variant, e.g. signatures
- security authorities NSA, BSI, NCSC, ANSSI stay highly reserved at this moment

- **Classical algorithms for classical computing platforms**

- post-quantum cryptographic suites
- recommended widespread approach and our main topic here

# The Algorithmic Approach of PQC

---

Traditional cryptosystems		Purpose	PQC Replacements	
Integer factorization	<b>RSA</b>	Encryption	Crystals-Kyber (ML-KEM, FIPS 203)	Learning with errors
Discrete logarithm	<b>ElGamal</b>			
	<b>DH</b>			
Elliptic curve discrete logarithm	<b>ECDH</b>			
Integer factorization	<b>RSA</b>	Signature	Crystals-Dilithium (ML-DSA, FIPS 204)	Learning with errors Short integer solution
Discrete logarithm	<b>DSA</b>		Falcon (FN-DSA, FIPS 206)*	
Elliptic curve discrete logatithm	<b>ECDSA</b>		SPHINCS+ (SLH-DSA, FIPS 205)	Hash inversion

# Learning With Errors (LWE)

standard, decision version

---

**Definition 1.** For positive integers  $m, n, q$ , and  $\beta < q$ , the  $\text{LWE}_{n,m,q,\beta}$  problem asks to distinguish between the following two distributions:

1.  $(\mathbf{A}, \mathbf{A}\mathbf{s} + \mathbf{e})$ , where  $\mathbf{A} \leftarrow \mathbb{Z}_q^{n \times m}$ ,  $\mathbf{s} \leftarrow [\beta]^m$ ,  $\mathbf{e} \leftarrow [\beta]^n$
2.  $(\mathbf{A}, \mathbf{u})$ , where  $\mathbf{A} \leftarrow \mathbb{Z}_q^{n \times m}$  and  $\mathbf{u} \leftarrow \mathbb{Z}_q^n$ .

$a \leftarrow S$  means that  $a$  is chosen uniformly at random from the set  $S$

$$[\beta] = \{-\beta, \dots, -1, 0, 1, \dots, \beta\}$$

furthermore, in practice, we usually set  $m = n$

# LWE Gate - General Definition

$$\Omega \times \alpha + \varepsilon = \beta$$

Standard-LWE $\lambda_0$	$\Omega \in \mathbb{F}_q^{n \times m} = \mathbb{Z}_q^{n \times m}$ $\alpha \in \mathbb{F}_q^m$ $\beta, \varepsilon \in \mathbb{F}_q^n$
Ring-LWE $\lambda_\rho$	$\Omega \in R_q = \mathbb{Z}_q[x] / \langle x^n + 1 \rangle$ $\alpha \in R_q$ $\beta, \varepsilon \in R_q$
Module-LWE $\lambda_\mu$	$\Omega \in R_q^{n \times m}, R_q$ <i>see above</i> $\alpha \in R_q^m$ $\beta, \varepsilon \in R_q^n$

# LWE Gate - Security Arguments

$$\Omega \times \alpha + \varepsilon = \beta$$

Standard-LWE $\lambda_0$	$\beta$ indistinguishable from $u \leftarrow [\mathbb{Z}_q^n]$ in particular, $\beta \mapsto \alpha$ is hard
Ring-LWE $\lambda_\rho$	$\beta$ indistinguishable from $u \leftarrow [R_q]$ in particular, $\beta \mapsto \alpha$ is hard
Module-LWE $\lambda_\mu$	$\beta$ indistinguishable from $u \leftarrow [R_q^n]$ in particular, $\beta \mapsto \alpha$ is hard

# Standard-LWE Encryption Scheme

setup phase

---

$$\vec{e}_1 \leftarrow [\beta_2]^m$$

$$\text{sk: } \vec{s} \leftarrow [\beta_1]^m$$

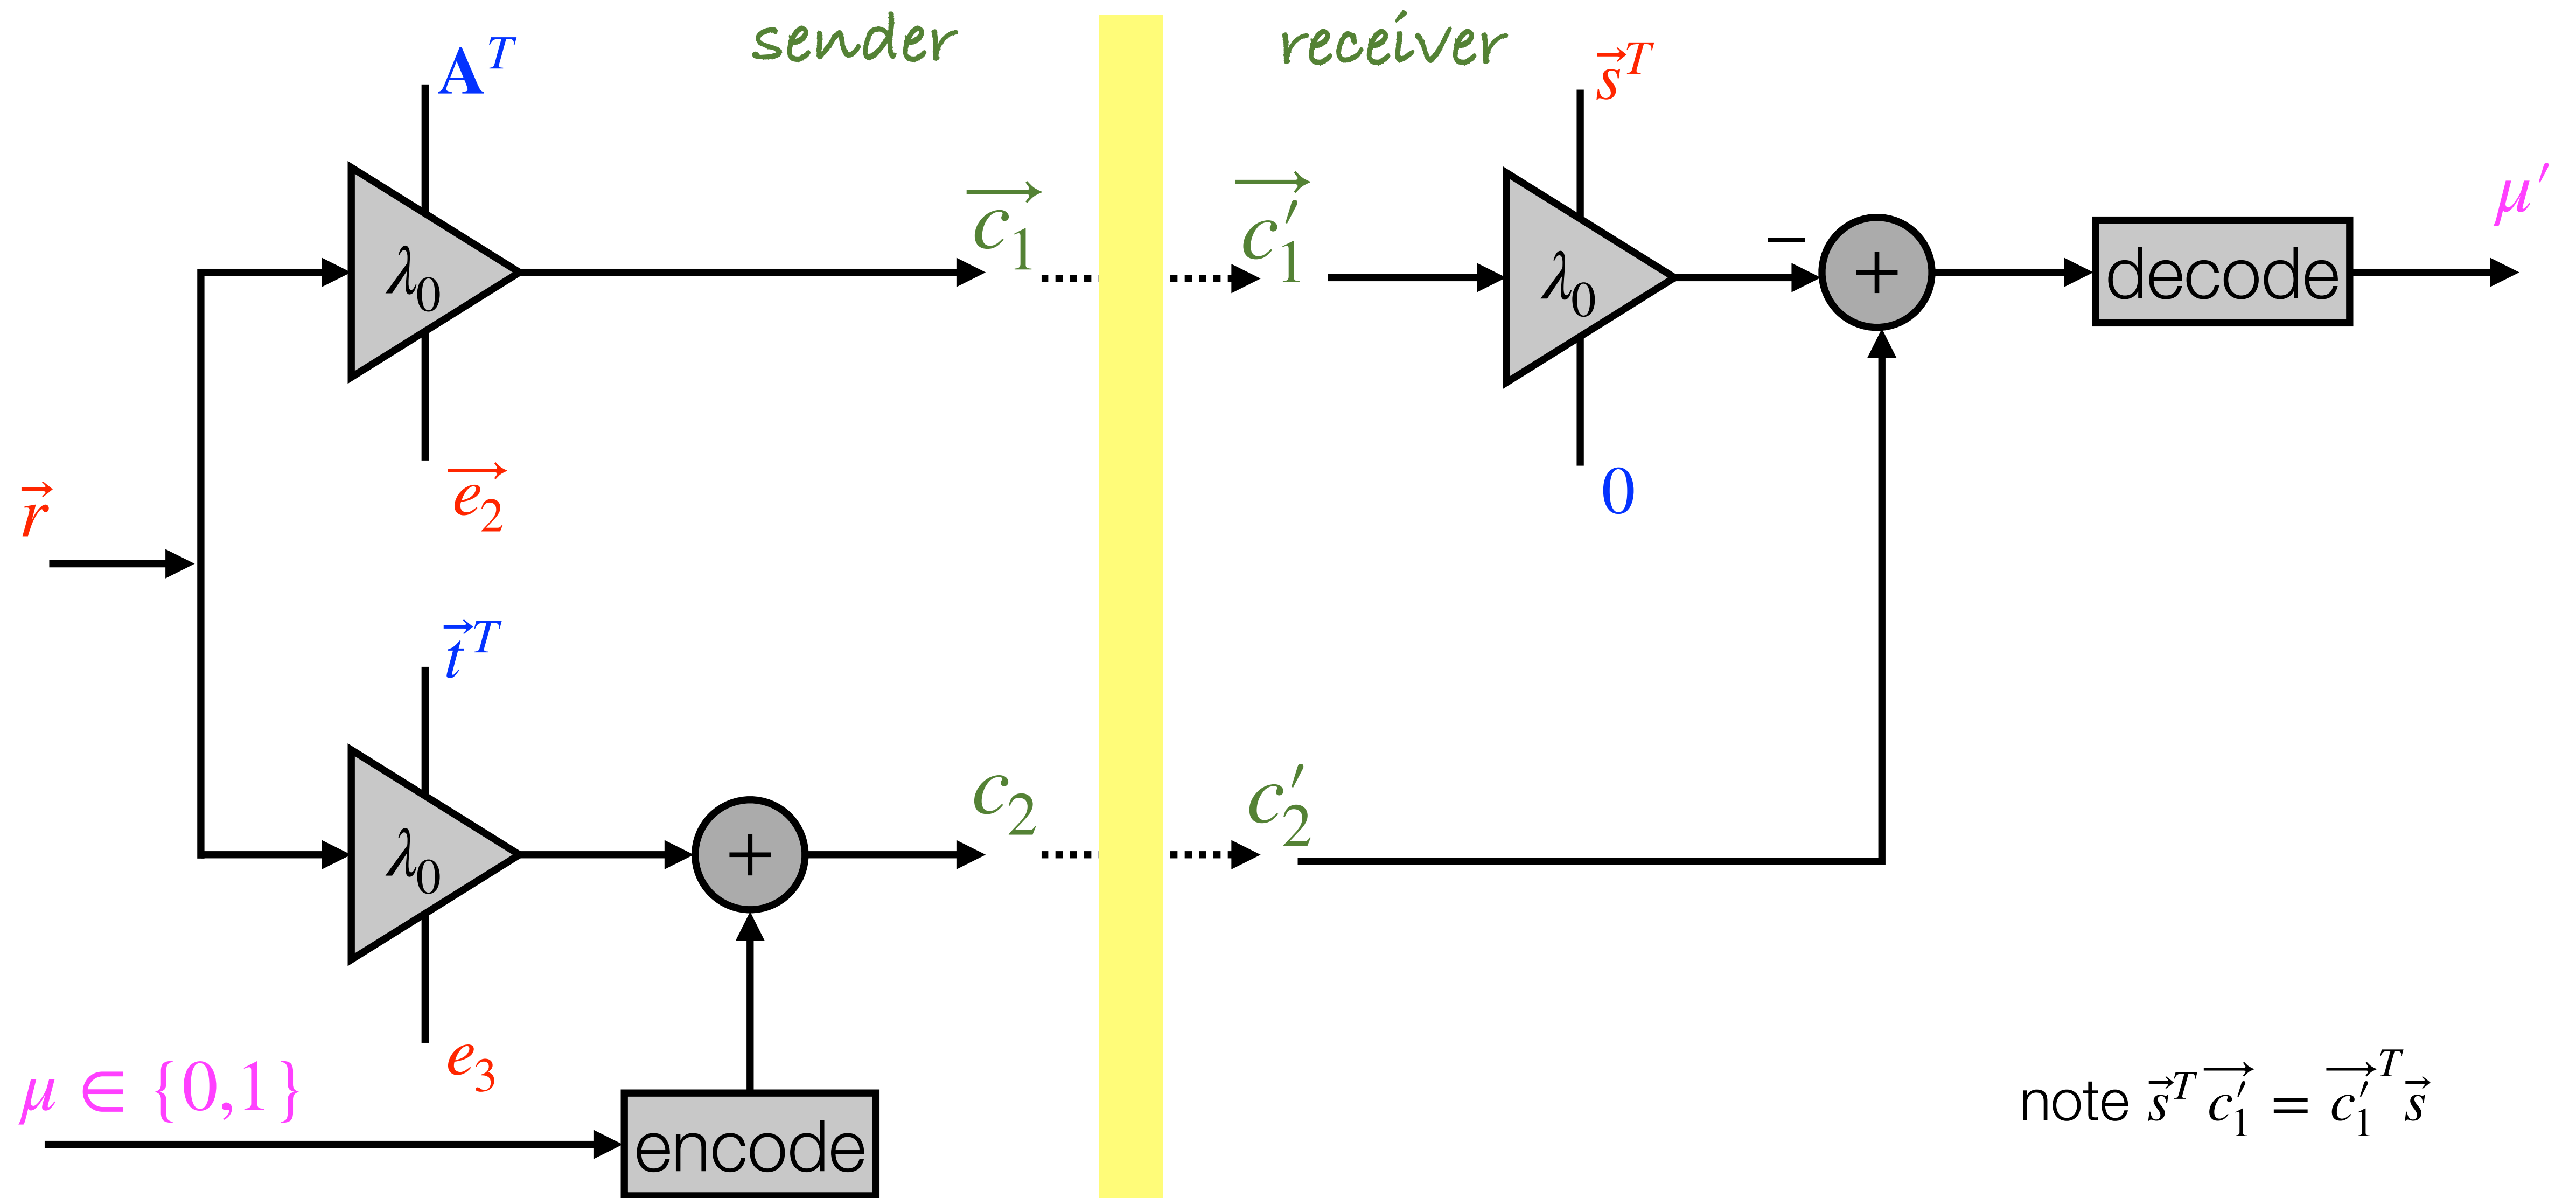

$$\text{pk: } \mathbf{A} \leftarrow \mathbb{Z}_q^{m \times m}$$

$$\text{pk: } \vec{t} = \mathbf{A}\vec{s} + \vec{e}_1$$

we set  $m = n$ , for the general LWE gate

# Standard-LWE Encryption Scheme

encryption/decryption of one-bit messages

# Standard-LWE Encryption Scheme

encryption/decryption of one-bit messages

sk:  $\vec{s} \leftarrow [\beta]^m$ , pk:  $(\mathbf{A} \leftarrow \mathbb{Z}_q^{m \times m}, \vec{t} = \mathbf{A}\vec{s} + \vec{e}_1)$ , where:  $\vec{e}_1 \leftarrow [\beta]^m$

note  $\vec{s}^T \mathbf{A}^T = \vec{t}^T - \vec{e}_1^T$

# Daring to be Like Diffie-Hellman...?

---

$$\Omega \times \alpha + \varepsilon$$

versus

$$g^a \bmod p$$

# Adjoint instead of Abelian Group

---

$$\langle \mathbf{A}\vec{v}, \vec{w} \rangle = \langle \vec{v}, \mathbf{A}^T \vec{w} \rangle$$

versus

$$(g^a)^b \pmod p = (g^b)^a \pmod p$$

Geometric interpretation invoking inner product and adjoint mechanics.

we ignore modulo q and stay with simple  $\mathbb{Z}^2 \subset \mathbb{R}^2$

# Ring-LWE Encryption Scheme

## setup phase

---

$$e_1(x) \leftarrow [\beta_2]$$

$$\text{sk: } s(x) \leftarrow [\beta_1]$$

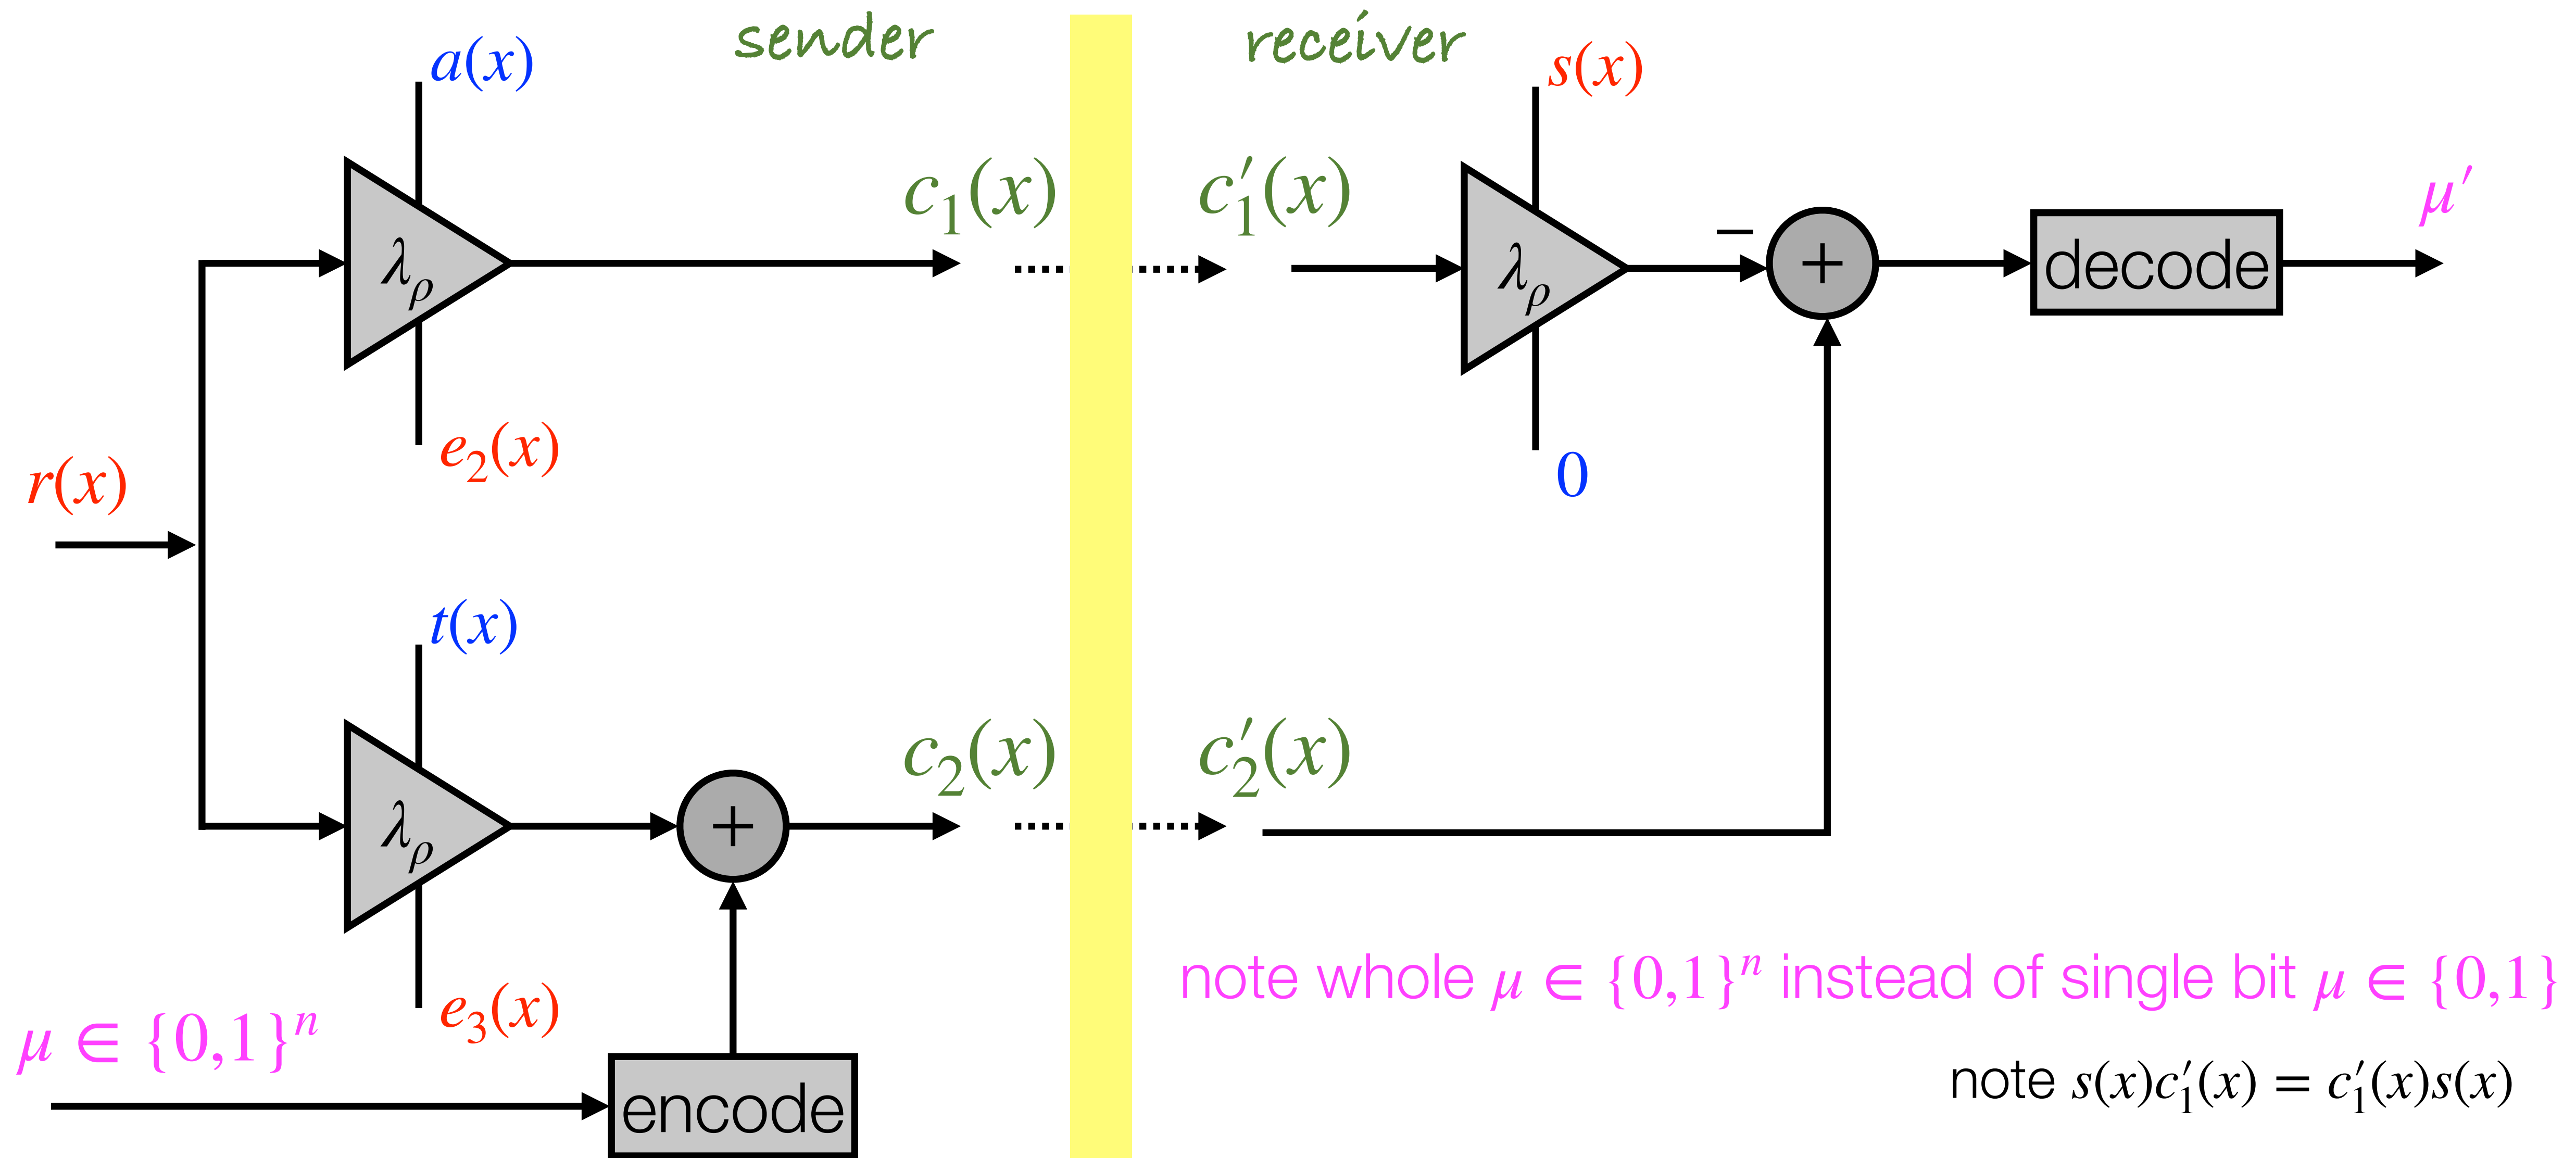

$$\text{pk: } \mathbf{A} \leftarrow R_q \left( = \mathbb{Z}_q[x] / \langle x^n + 1 \rangle \right)$$

$$\text{pk: } t(x) = a(x) \times s(x) + e_1(x)$$

$p(x) \leftarrow S$  means that  $p(x)$  coefficients are all chosen uniformly at random from the set  $S$

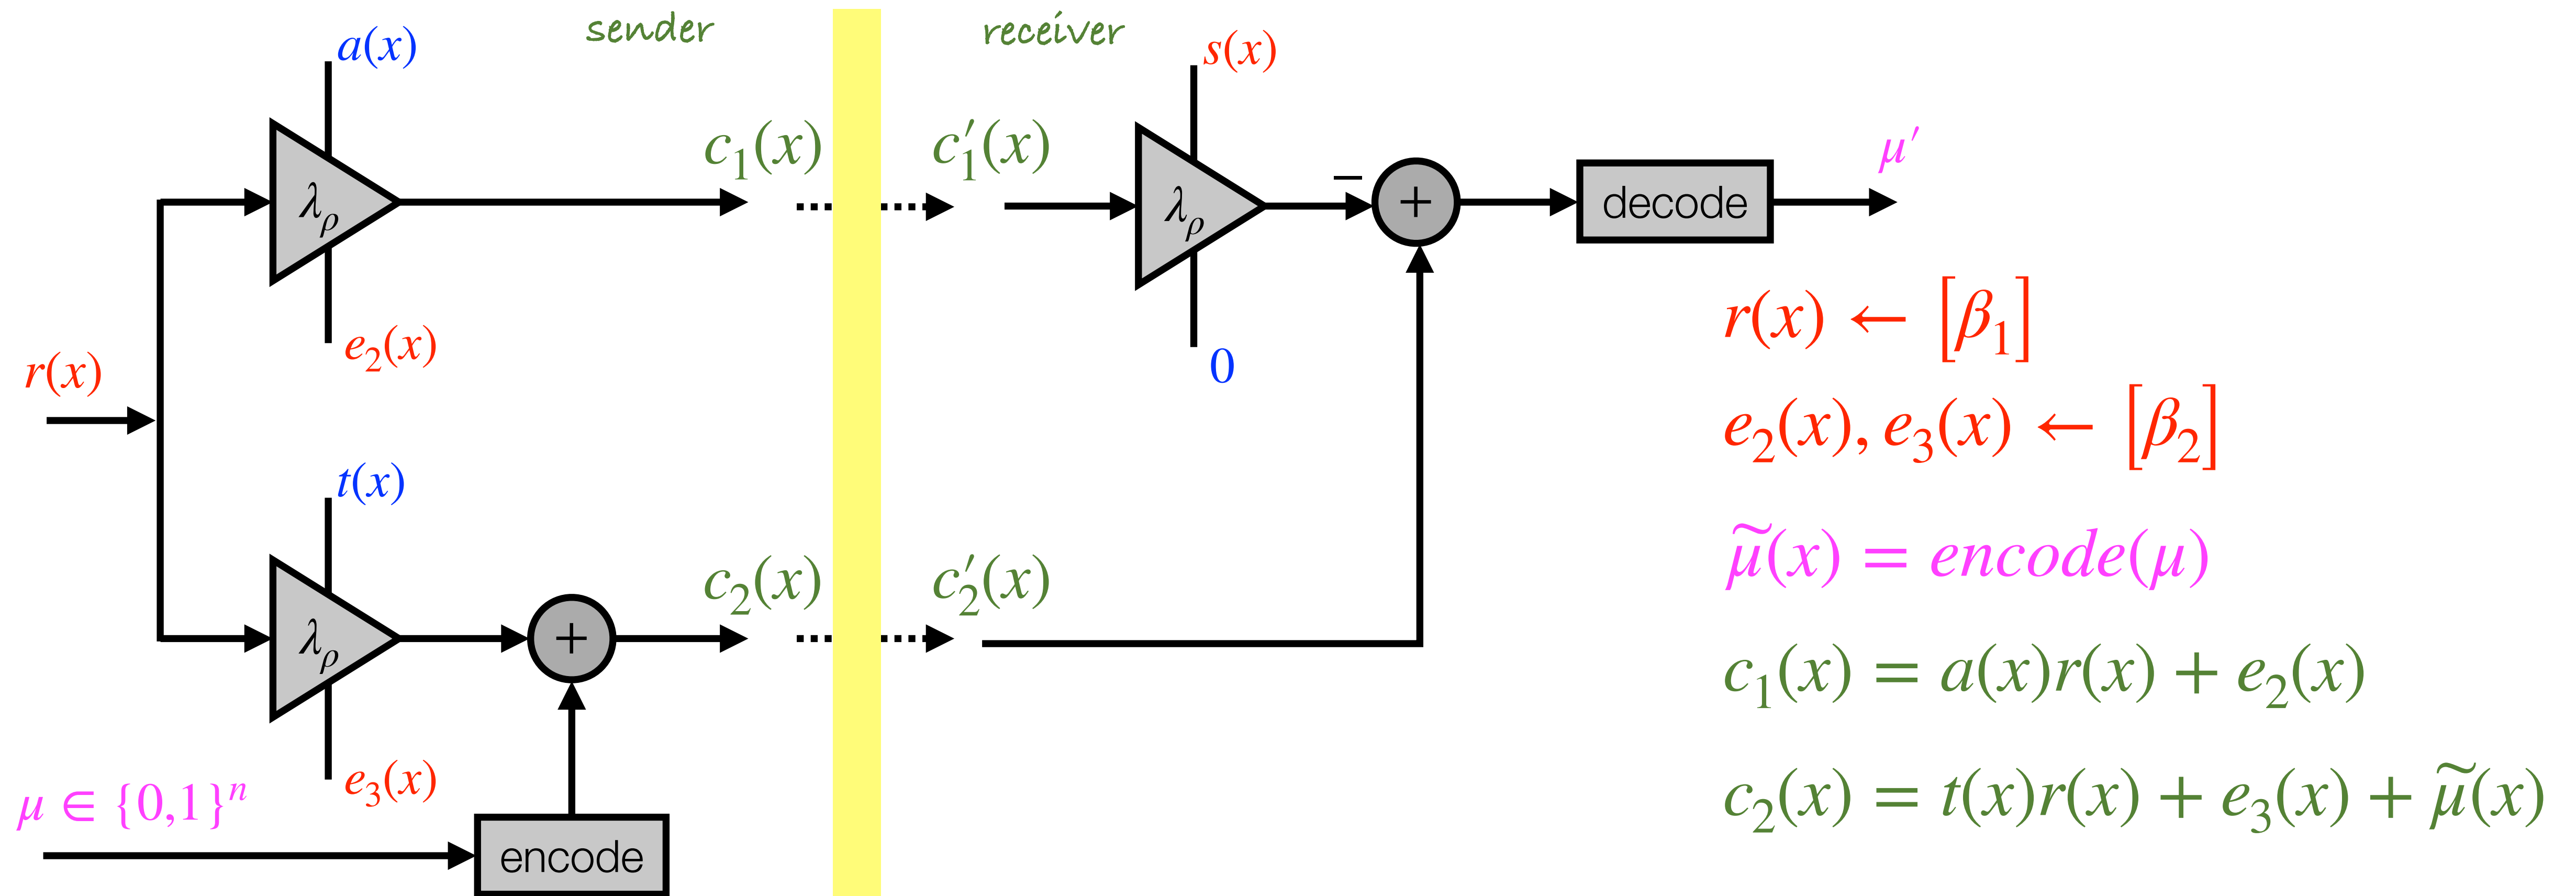

# Ring-LWE Encryption Scheme

encryption/decryption of  $n$ -bit messages

# Ring-LWE Encryption Scheme

encryption/decryption of  $n$ -bit messages

$$r(x) \leftarrow [\beta_1]$$

$$e_2(x), e_3(x) \leftarrow [\beta_2]$$

$$\tilde{\mu}(x) = \text{encode}(\mu)$$

$$c_1(x) = a(x)r(x) + e_2(x)$$

$$c_2(x) = t(x)r(x) + e_3(x) + \tilde{\mu}(x)$$

$$\begin{aligned} c_2(x) - s(x)c_1(x) &= t(x)r(x) + e_3(x) + \tilde{\mu}(x) - t(x)r(x) + e_1(x)r(x) - s(x)e_2(x) \\ &= e_1(x)r(x) - s(x)e_2(x) + e_3(x) + \tilde{\mu}(x) \end{aligned}$$

note  $s(x)a(x) = t(x) - e_1(x)$

# Linear Algebra Viewpoint

---

Let  $a(x), b(x) \in \mathbb{Z}[x] / \langle f(x) \rangle$  and fix  $a(x)$ , then:

$$a(x)b(x) = a(x) \sum_{i=0}^{d-1} b_i x^i \pmod{f(x)} = \sum_{i=0}^{d-1} b_i (a(x)x^i \pmod{f(x)}).$$

This can be interpreted as:  $\overrightarrow{a(x)b(x)} = \mathbf{A} \overrightarrow{b(x)}$ , for  $\mathbf{A} \in \mathbb{Z}^{d \times d}$  with columns:

$$\mathbf{A} = \left( \overrightarrow{a(x)}, \overrightarrow{a(x)x \pmod{f(x)}}, \dots, \overrightarrow{a(x)x^{d-1} \pmod{f(x)}} \right).$$

$$\overrightarrow{a(x)s(x)r(x)} = \overrightarrow{a(x)r(x)s(x)}$$

$$\mathbb{Z}[x]/\langle x^2 - 1 \rangle$$

$$a(x) = 2 + 1x, \overrightarrow{a(x)} = \begin{pmatrix} 2 \\ 1 \end{pmatrix}, \mathbf{A} = \begin{pmatrix} 2 & 1 \\ 1 & 2 \end{pmatrix}$$

$$s(x) = 1 + 2x, \overrightarrow{s(x)} = \begin{pmatrix} 1 \\ 2 \end{pmatrix}$$

$$r(x) = 3 + 1x, \overrightarrow{r(x)} = \begin{pmatrix} 3 \\ 1 \end{pmatrix}$$

$$\overrightarrow{a(x)s(x)} = \begin{pmatrix} 4 \\ 5 \end{pmatrix}$$

$$\overrightarrow{a(x)r(x)} = \begin{pmatrix} 7 \\ 5 \end{pmatrix}$$

$$\mathbb{Z}^2 \subset \mathbb{R}^2$$

# Module-LWE Encryption Scheme

setup phase

---

$$\vec{e}_1 \leftarrow [\beta_2]^m$$

$$\text{sk: } \vec{s} \leftarrow [\beta_1]^m$$

$$\text{pk: } \mathbf{A} \leftarrow R_q^{m \times m}, R_q = \mathbb{Z}_q[x] / \langle x^n + 1 \rangle$$

$$\text{pk: } \vec{t} = \mathbf{A}\vec{s} + \vec{e}_1$$

we set  $m = n$ , for the general LWE gate

# Example: $R_q^k$

♦ Let  $q = 137$ ,  $n = 4$ ,  $R_q = \mathbb{Z}_{137}[x]/(x^4 + 1)$ ,  $k = 3$ .

♦ Let  $a = \begin{bmatrix} 93 + 51x + 34x^2 + 54x^3 \\ 27 + 87x + 81x^2 + 6x^3 \\ 112 + 15x + 46x^2 + 122x^3 \end{bmatrix}$  and  $b = \begin{bmatrix} 40 + 78x + x^2 + 119x^3 \\ 11 + 31x + 57x^2 + 90x^3 \\ 108 + 72x + 47x^2 + 14x^3 \end{bmatrix} \in R_q^k$ .

♦ Then  $a + b = \begin{bmatrix} 133 + 129x + 35x^2 + 36x^3 \\ 38 + 118x + x^2 + 96x^3 \\ 83 + 87x + 93x^2 + 136x^3 \end{bmatrix}$ ,  $a - b = \begin{bmatrix} 53 + 110x + 33x^2 + 72x^3 \\ 16 + 56x + 24x^2 + 53x^3 \\ 4 + 80x + 136x^2 + 108x^3 \end{bmatrix}$ ,

and  $a \cdot b^T = a[1]b[1] + a[2]b[2] + a[3]b[3] = 93 + 59x + 44x^2 + 132x^3$ .

Published August 13, 2024

- Fujisaki-Okamoto extension to convert IND-CPA scheme to CCA2 secure one
- Number Theoretic Transform for faster ring operations
- Mandatory and recommended security checks
- Key and ciphertext data length optimizations
- Precise definition of the three parametric ML-KEM schemes based on M-LWE
  - *Module Lattice* refers to lattices corresponding to certain  $R$ -modules

[\[https://doi.org/10.6028/NIST.FIPS.203\]](https://doi.org/10.6028/NIST.FIPS.203)

---

**Algorithm 17** `ML-KEM.Encaps_internal`(ek,  $m$ )

---

*Uses the encapsulation key and randomness to generate a key and an associated ciphertext.*

**Input:** encapsulation key  $ek \in \mathbb{B}^{384k+32}$ .

**Input:** randomness  $m \in \mathbb{B}^{32}$ .

**Output:** shared secret key  $K \in \mathbb{B}^{32}$ .

**Output:** ciphertext  $c \in \mathbb{B}^{32(d_u k + d_v)}$ .

1:  $(K, r) \leftarrow \mathbf{G}(m \parallel \mathbf{H}(ek))$

2:  $c \leftarrow \mathbf{K-PKE.Encrypt}(ek, m, r)$

3: **return**  $(K, c)$

▷ derive shared secret key  $K$  and randomness  $r$

▷ encrypt  $m$  using K-PKE with randomness  $r$

---

**Algorithm 18** `ML-KEM.Decaps_internal`(dk, c)

*Uses the decapsulation key to produce a shared secret key from a ciphertext.*

**Input:** decapsulation key  $dk \in \mathbb{B}^{768k+96}$ .

**Input:** ciphertext  $c \in \mathbb{B}^{32(d_u k + d_v)}$ .

**Output:** shared secret key  $K \in \mathbb{B}^{32}$ .

- 1:  $dk_{\text{PKE}} \leftarrow dk[0 : 384k]$  ▷ extract (from KEM decaps key) the PKE decryption key
- 2:  $ek_{\text{PKE}} \leftarrow dk[384k : 768k + 32]$  ▷ extract PKE encryption key
- 3:  $h \leftarrow dk[768k + 32 : 768k + 64]$  ▷ extract hash of PKE encryption key
- 4:  $z \leftarrow dk[768k + 64 : 768k + 96]$  ▷ extract implicit rejection value
- 5:  $m' \leftarrow \text{K-PKE.Decrypt}(dk_{\text{PKE}}, c)$  ▷ decrypt ciphertext
- 6:  $(K', r') \leftarrow G(m' \| h)$
- 7:  $\bar{K} \leftarrow J(z \| c)$
- 8:  $c' \leftarrow \text{K-PKE.Encrypt}(ek_{\text{PKE}}, m', r')$  ▷ re-encrypt using the derived randomness  $r'$
- 9: **if**  $c \neq c'$  **then**
- 10:      $K' \leftarrow \bar{K}$  ▷ if ciphertexts do not match, “implicitly reject”
- 11: **end if**
- 12: **return**  $K'$

**Table 2. Approved parameter sets for ML-KEM**

	$n$	$q$	$k$	$\eta_1$	$\eta_2$	$d_u$	$d_v$	required RBG strength (bits)

ML-KEM-1024	1568	3168	1568	32

# Short Integer Solution (SIS)

- standard, search version

---

**Definition 4.1.1 (Short Integer Solution (SIS<sub>n,q,β,m</sub>)).** Given  $m$  uniformly random vectors  $\mathbf{a}_i \in \mathbb{Z}_q^n$ , forming the columns of a matrix  $\mathbf{A} \in \mathbb{Z}_q^{n \times m}$ , find a nonzero integer vector  $\mathbf{z} \in \mathbb{Z}^m$  of norm  $\|\mathbf{z}\| \leq \beta$  such that

$$f_{\mathbf{A}}(\mathbf{z}) := \mathbf{A}\mathbf{z} = \sum_i \mathbf{a}_i \cdot z_i = \mathbf{0} \in \mathbb{Z}_q^n. \quad (4.1.1)$$

# LWE Gate from the SIS Viewpoint

---

$$\Omega' \times \begin{bmatrix} \alpha \\ \varepsilon \end{bmatrix} = 0$$

homogeneous case

$$\Omega' = [\Omega \parallel \mathbf{I}]$$

$$\Omega' \times \begin{bmatrix} \alpha \\ \varepsilon \end{bmatrix} = \beta \neq 0$$

inhomogeneous case

The homogeneous and inhomogeneous problems are essentially equivalent for typical params.

[Peikert, <https://ia.cr/2015/939>]

# LWE or SIS - Heuristic Arguments

---

- Are we searching for **the particular solution** that we know it exists and that was used to setup the problem by opponent? *The noisy vector is primarily just an obstacle.*
  - we view the solution as a short **coordinate vector** for a lattice
  - we apply **Bounded-Distance-Decoding** to find the solution
- Or, are we searching for “**something like this**” **instead**, without any a priori hint anything like this was used to setup the problem by opponent? *The noisy vector is a natural part of the solution.*
  - we view the solution as a certain short **lattice vector directly**
  - we apply a sort of a **Short-Vector-Problem** to find the solution

LWE

SIS

up to a scaling factor, the lattices mentioned for LWE and SIS are duals of each other.

[Peikert, <https://ia.cr/2015/939>]

# Module-LWE/SIS Signature Scheme

## setup phase

---

$$\text{sk: } \vec{s}_1 \leftarrow [\beta_1]^l, \vec{s}_2 \leftarrow [\beta_1]^k$$

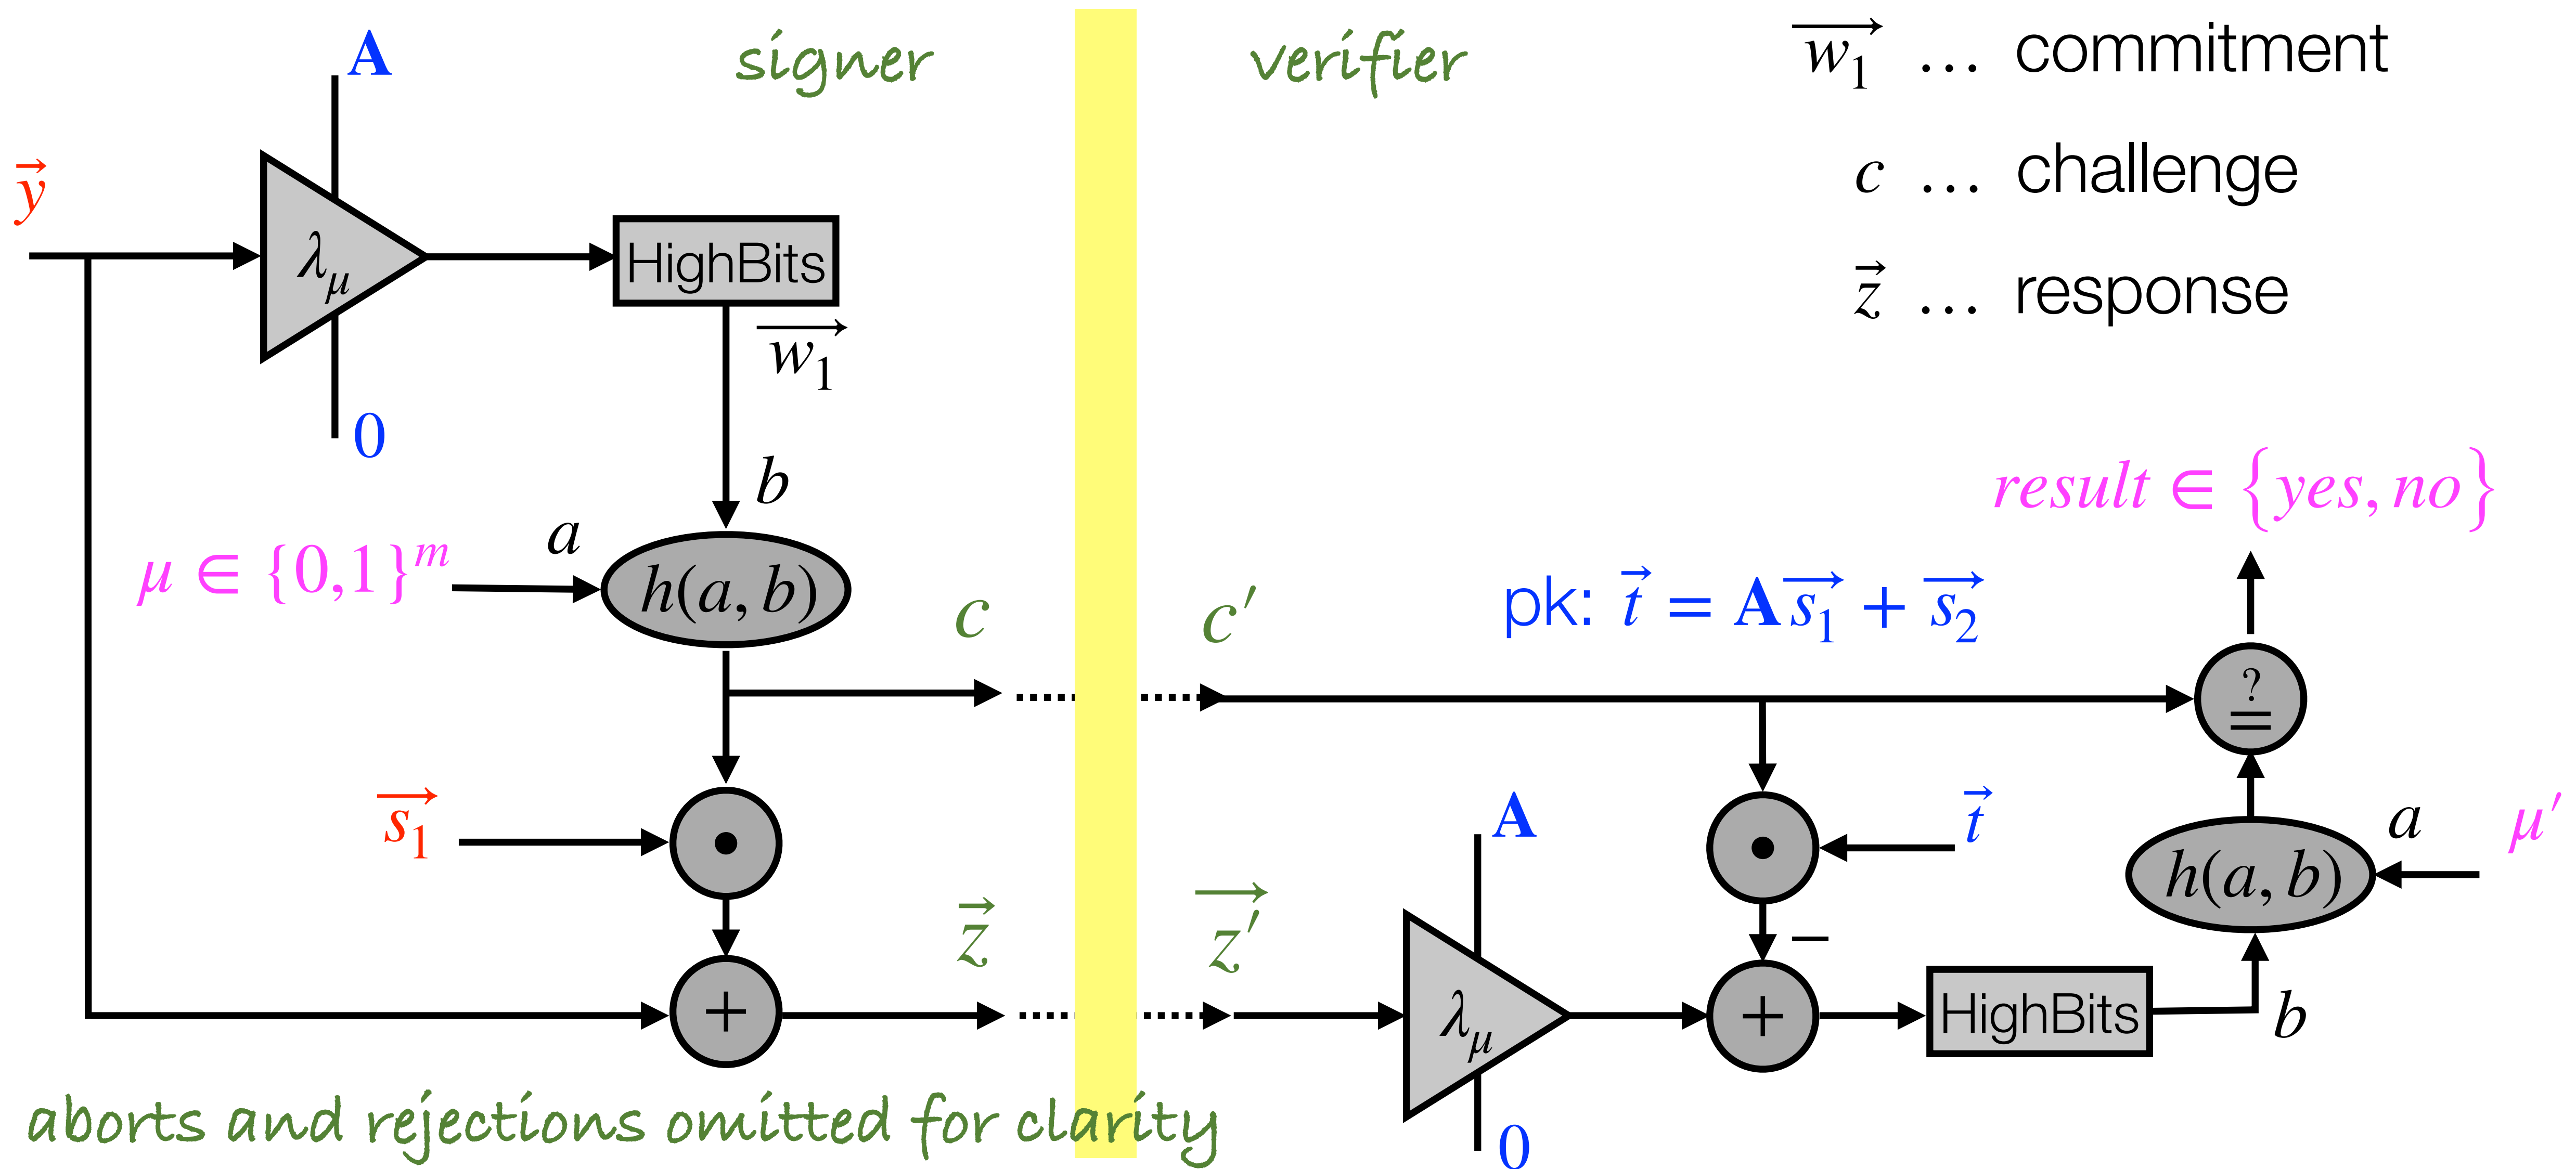

$$\text{pk: } \mathbf{A} \leftarrow R_q^{k \times l}, R_q = \mathbb{Z}_q[x] / \langle x^n + 1 \rangle$$

$$\text{pk: } \vec{t} = \mathbf{A}\vec{s}_1 + \vec{s}_2$$

the noise vector  $\vec{s}_2$  is a part of the secret private key; it governs Aborts in Fiat-Shamir later on

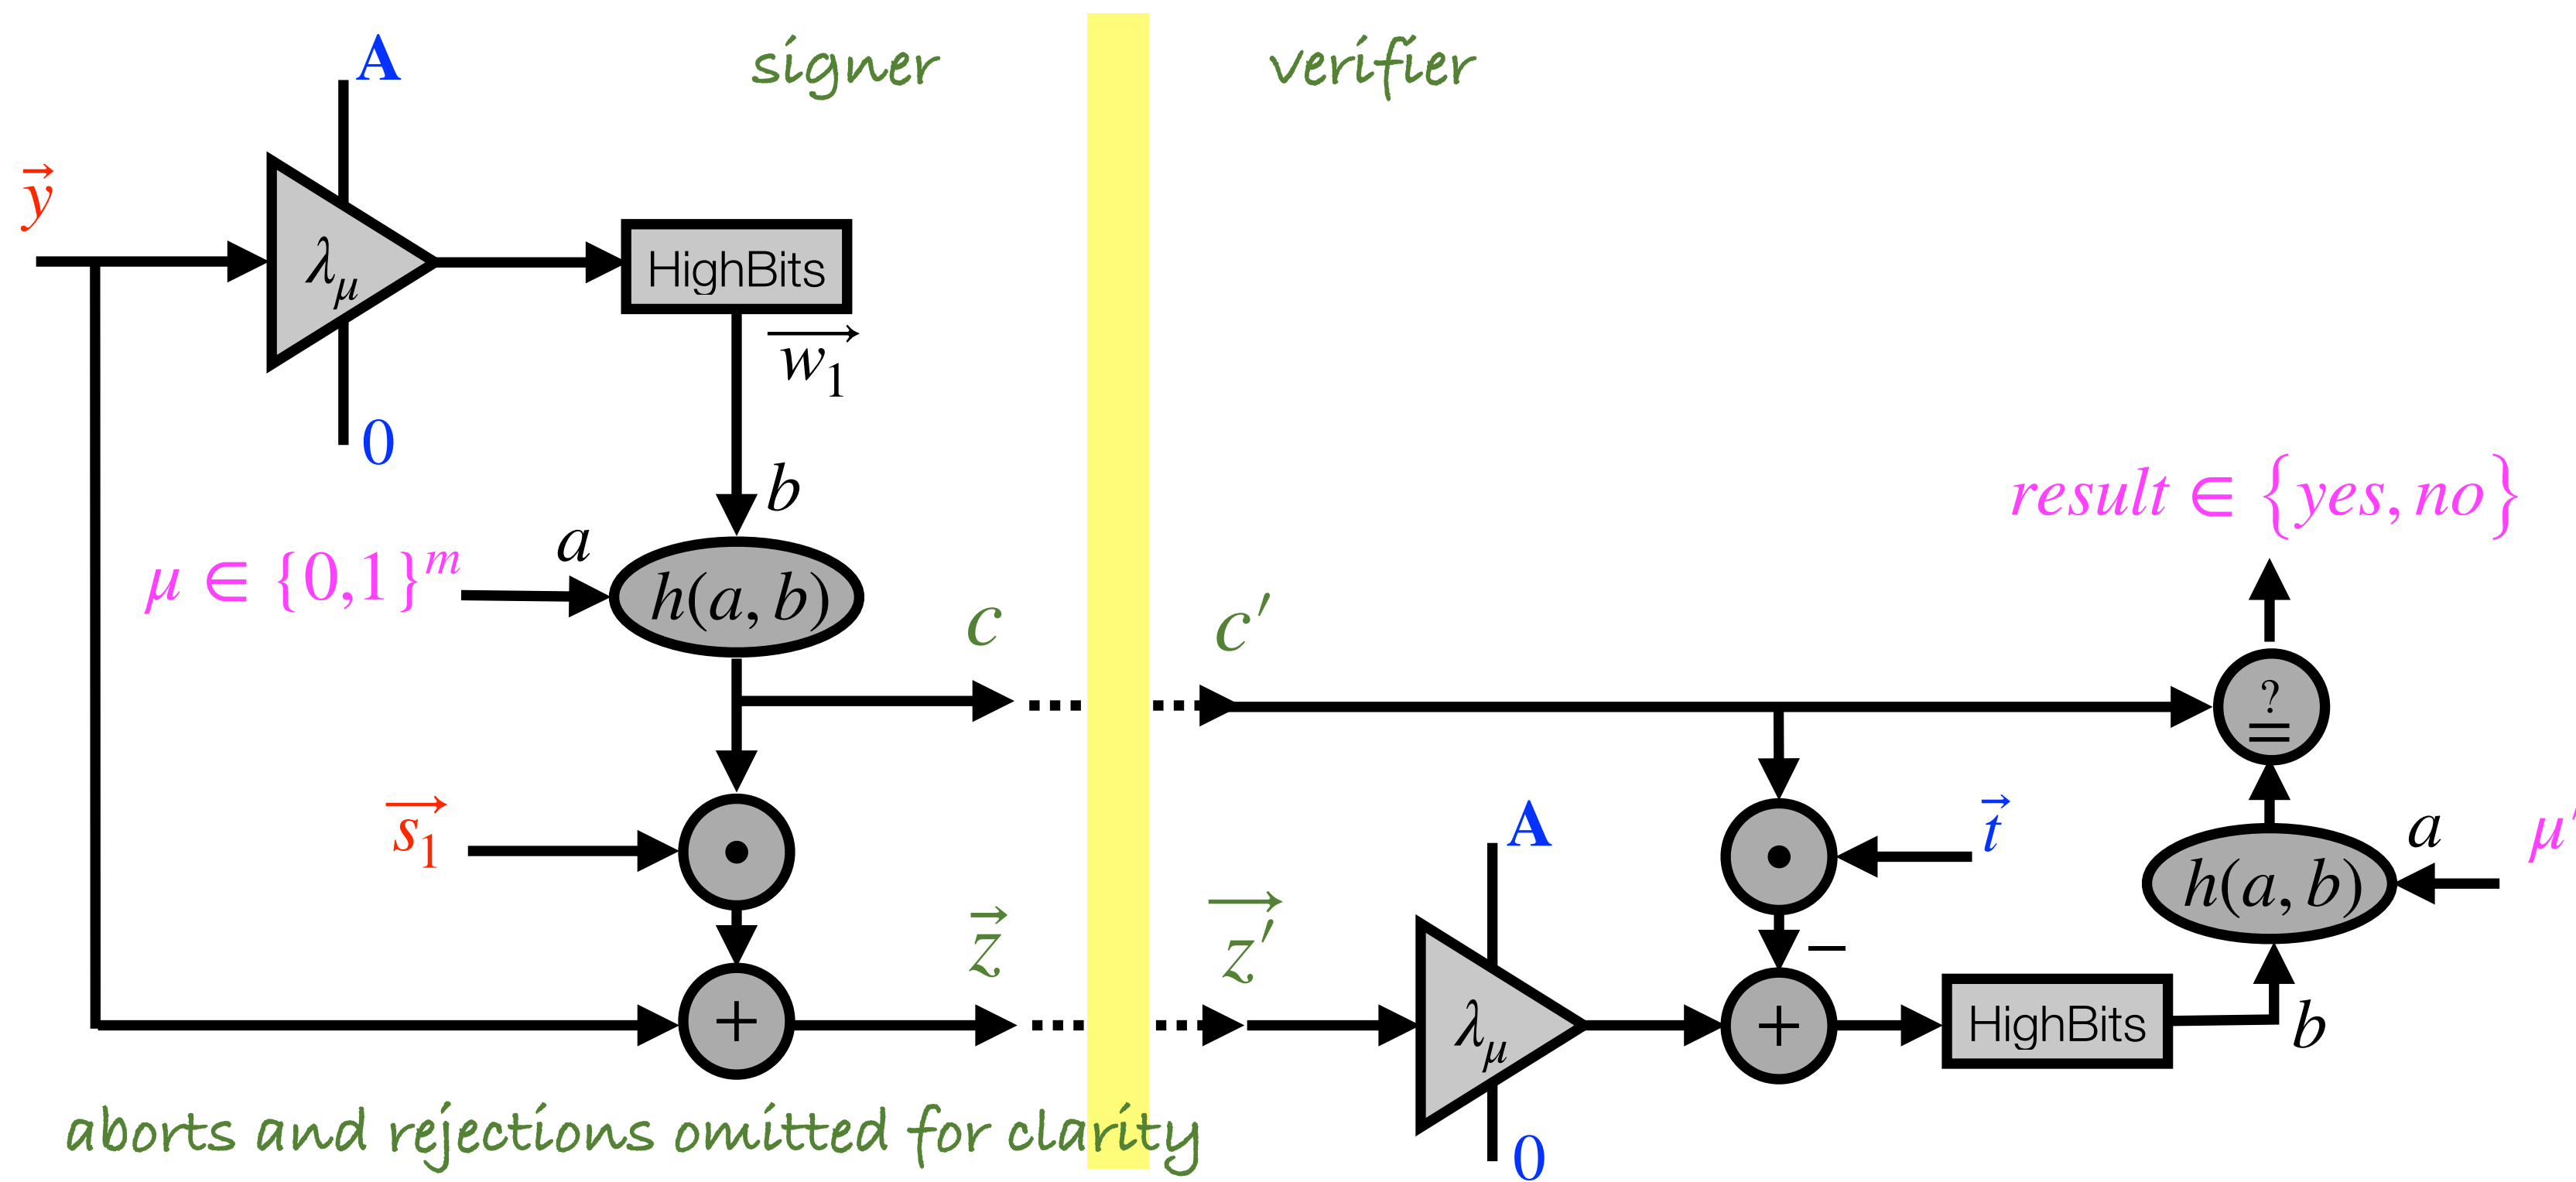

# Module-LWE/SIS Schnorr-Fiat-Shamir Signature Scheme

signature generation/verification

# Module-LWE/SIS Schnorr-Fiat-Shamir Signature Scheme

## signature generation/verification

$$\vec{w}_1 = \text{HighBits}(\mathbf{A}\vec{z} - c\vec{t})$$

$$c \stackrel{?}{=} h(\mu, \vec{w}_1)$$

$$\mathbf{A}\vec{z} - c\vec{t} = \mathbf{A}\vec{y} + c\vec{t} - c\vec{s}_2 - c\vec{t}$$

$$= \mathbf{A}\vec{y} - c\vec{s}_2$$

note  $\mathbf{A}\vec{s}_1 = \vec{t} - \vec{s}_2^T$

pick a small random  $\vec{y}$  and compute  $\vec{w}_1 = \text{HighBits}(\mathbf{A}\vec{y})$

$$c = h(\mu, \vec{w}_1), \vec{z} = \vec{y} + c\vec{s}_1$$

# Module-LWE/SIS Schnorr-Fiat-Shamir Signature Scheme

## forgery through Module-SIS

$$\text{HighBits}(\mathbf{A}\vec{z} - c\vec{t}) \stackrel{!}{=} \vec{w}_1$$

$$\mathbf{A}\vec{z} - c\vec{t} = 2\gamma_2\vec{w}_1 + \vec{w}_0$$

$$\mathbf{A}\vec{z} - \vec{w}_0 = c\vec{t} + 2\gamma_2\vec{w}_1$$

$$[\mathbf{\Omega} \parallel \mathbf{I}] \times \begin{bmatrix} \vec{z} \\ \vec{w}_0 \end{bmatrix} = c\vec{t} + 2\gamma_2\vec{w}_1$$

we pick  $\vec{w}_1$  at random and compute  $c = h(\mu, \vec{w}_1)$

the remaining task is to find a correct  $\vec{z}$

**MSIS**

# Vulnerabilities we went through before and probably will go again

---

- Implementation faults, for instance:
  - faulty encryption/decryption
  - faulty signature generation/verification
- Computational faults
  - such as were RSA-CRT vulnerabilities
- Side channels
  - sensitive data leakage

# Recent Example - EUCLEAK Attack on YubiKey Series 5

- FIDO2 and EAL5+ certified cryptographic device
- ECDSA implementation broken via EM side channel
- Possibly affects broader area of security microcontrollers by Infineon and **broader protocols area**
- The failure is in **radiating modular inversion procedure**
- There is a modular inversion in PACE-CAM(\*) involving chip private key  $z_A$

Figure 1.4: YubiKey 5Ci – EM Acquisition Setup

— <https://ninjalab.io/eucleak/>

\*) **PACE-CAM** employed in NFC passports and ID cards (SK)

# NTT - Number Theoretic Transform

---

- Specialized discrete Fourier transform to speed up multiplication in certain rings of convolution polynomials
- Can be also interpreted as a sort of Chinese Remainder Theorem machinery
- Is a vital core of LWE based algorithms ML-KEM and ML-DSA
- Is a fruitful target of **fault and side channel attacks**

$$R_q := \mathbb{Z}_q[X]/(X^{256} + 1) \quad T_q := \bigoplus_{i=0}^{127} \mathbb{Z}_q[X]/(X^2 - \zeta^{2\text{BitRev}_7(i)+1})$$

$$\hat{f} := (f \bmod (X^2 - \zeta^{2\text{BitRev}_7(0)+1}), \dots, f \bmod (X^2 - \zeta^{2\text{BitRev}_7(127)+1}))$$

$$f \times_{R_q} g = \text{NTT}^{-1}(\hat{f} \times_{T_q} \hat{g})$$

# Floating Point FFT in FALCON (FN-DSA)

---

- Automatic offloading of sensitive computation to a Floating Point Unit (FPU) naturally invokes side-channels that are uneasy to predict and prevent

## 4.1 Floating-Point

Signature generation, and also part of key pair generation, involve the use of complex numbers. These can be approximated with standard IEEE 754 floating-point numbers (“binary64” format, commonly known as “double precision”). Each such number is encoded over 64 bits, that split into the following elements:

- a sign  $s = \pm 1$  (1 bit);
- an exponent  $e$  in the  $-1022$  to  $+1023$  range (11 bits);
- a mantissa  $m$  such that  $1 \leq m < 2$  (52 bits).

In general, the represented value is  $sm2^e$ . The mantissa is encoded as  $2^{52}(m - 1)$ ; it has 53 bits of precision, but its top bit, of value 1 by definition, is omitted in the encoding.
